

Project Operations & Billing Dashboard

Excel-Based Workflow, Billing & Documentation System

ERIC AMOH ADJEI

The Problem

Today's project environments suffer from fragmentation — data lives in silos, billing is reactive, and no single source of truth exists.

Scattered Data

Project info spread across emails, spreadsheets, and shared drives

Delayed Billing

Invoice cycles lag behind project milestones, straining cash flow

Poor Doc Tracking

Critical documents go missing or are versioned incorrectly

No Visibility

Workflow bottlenecks go undetected until it's too late to act

THE OPPORTUNITY

One System. Total Clarity.

Organizations need a centralized, real-time view of projects, billing, and documentation — without expensive enterprise software.

The **Project Operations & Billing Dashboard** is a purpose-built Excel system that delivers enterprise-grade visibility using tools teams already have.

→ Centralized Operations

All project data in one structured workbook

→ Zero New Software

Built entirely in Microsoft Excel — no licensing required

System Architecture

Five integrated modules form the backbone of the dashboard — each purpose-built, and all interconnected.

Project Dashboard

Real-time project status, timelines, and milestone tracking across all active engagements

Billing Tracker

Invoice aging, payment status, and cost variance monitoring in a single view

Document Control

Version-controlled document logs with status flags and ownership assignments

Inventory Tracker

Material levels, alerts for low stock, and consumption tracking by project

Workflow Pipeline

Stage-by-stage task progression with bottleneck identification and ownership clarity

Key Features

Every module is built around actionable metrics — designed for operations managers and billing leads who need answers at a glance.

KPI Tracking

Live performance indicators across cost, schedule, and quality dimensions

Invoice Aging

Automatically flags overdue invoices by days outstanding with color thresholds

Cost Variance

Budget vs. actual spend tracked at the line-item and project level

Document Logs

Timestamped submission records with revision history and approval status

Inventory Alerts

Threshold-based alerts notify teams before critical materials run out

Built-In Automation

The dashboard eliminates manual effort through intelligent Excel mechanics — delivering dynamic, self-updating outputs without macros or external tools.

01

Smart Formulas

Automated calculations for totals, variances, aging, and alerts

02

Conditional Formatting

Color-coded risk signals that update instantly as data changes

03

Dropdown Tracking

Standardized data entry via validated dropdowns — reducing input errors

04

Risk Indicators

Automatic red/amber/green flags based on defined performance thresholds

Business Impact

The dashboard delivers measurable operational improvements — from the first week of deployment.

Better Visibility

Leadership and project teams share one unified source of truth across all active work

Reduced Delays

Proactive alerts and aging flags surface issues before they become costly escalations

Improved Coordination

Cross-functional teams stay aligned through shared workflows and document logs

Accurate Billing

Invoice tracking tied to project milestones ensures nothing is missed or double-billed

Real-World Use Cases

The system is designed for operations-heavy environments where project complexity, billing accuracy, and documentation compliance matter most.

Data Centers

Track rack deployments, cabling milestones, and vendor billing across large-scale infrastructure projects

Network Cabling

Manage structured cabling jobs, material consumption, and progress billing by zone or floor

Construction Operations

Coordinate subcontractors, track RFIs and submittals, and monitor cost performance against the project budget

ABOUT THE DESIGNER

My Role & Differentiation

This system was conceived, designed, and built end-to-end — not adapted from a template, but engineered from first principles around real operational challenges.

What sets this apart: most Excel tools stop at data entry. This system **thinks operationally** — surfacing insights, flagging risks, and guiding decisions automatically.

1

System Design

Architected the five-module structure and defined all data relationships

2

Dashboard Build

Built every formula, format rule, and layout — optimized for speed and clarity

3

Workflow Modeling

Mapped real operational workflows into structured, trackable pipeline stages

What's Next

FUTURE ENHANCEMENTS

This dashboard proves that operational excellence doesn't require enterprise software. It requires **disciplined design, systems thinking, and a deep understanding of how operations actually work.**

The foundation is built. The value is proven. The next phase scales it further — ready to support organizations operating at any level of complexity.

📄 Designed & built by **Eric Amoh Adjei** — available to bring this systems thinking to your operations team.
